Introduction

Christine Bonneville

This proposal from our start-up company, UX 4 U, LLC, will cover the preliminary research for developing the front end of a business desktop recruitment application called MedMart. The application will serve both private and public sector establishments from Ontario, Canada, in the hiring of medical professionals. This outline includes the brainstorming, description, research, technical requirements, and market survey currently developed for the creation of MedMart.

Brainstorming

Tulsi Patel

Business Names:

- UX 4 U, LLC for our start-up company name (purple, blue, white)
    - consists of developers and designers
    - create applications for governments, businesses and non-profit organizations
    - based in Waterloo, Ontario
    - applications ensure proper functionality, efficiency and user-friendly features
    - believe in creating applications that cater to our clients and its consumers
- Medical Mart for app (green, blue, purple, white)

Type of businesses who would use this app:

- Small Clinics
- Walk-in Clinic
- Hospitals
- Medical suppliers

Type of Employees who would use this app:

- Nurses
- Doctors
- Different types of health specialties
- Medical students

- Locum professionals (travel doctor, travel nurses)
    - is a temporary doctor that fills in for employees on temporary leave

Scenarios in which the app would be used:

- Public and Private Businesses would use this app for, including NGOs/NPOs:
    - Job posting
        - need staff
        - Employees go on temporary leave (parental leave, health problems, family emergency)

- For medical supply retailers
    - looking for staff who are familiar with different areas of the health and medicine fields

- Employers would use this app:
    - Looking for job
        - Lack of job opportunities in their home country
        - Better salary
        - Moving to a different country to Ontario for a better lifestyle

- Non-profit Organizations
    - need of healthcare professionals

How to reduce risks if mistakes were made:

- Ensure clear communication between the recruiter and potential employee
    - Send a confirmation email to the candidate when they submit their applications

    - Put a status option so candidates can see at which stage their application is at
    - Follow up with the recruiter and candidate if they don’t respond within a set time frame
- Check to see if the applicant meets the requirements of the job posting
    - Uploaded supporting documents (e.g., Education, Résumé, Language)
- Customer Support to report any problems whether technical or questions regarding job application

Description

Christine Bonneville

UX 4 U's plan for the MedMart application is to create a desktop website that will seamlessly assist public and private Ontario businesses with the recruitment of health professionals. MedMart's purpose is to be the hub to connect much needed doctors, nurses, and other health experts, with various organizations that have a like-minded goal to meet their community's needs. An example would be a private clinic doctor in a small town, who is looking for a few nurses and a couple doctors to run a non-profit clinic that provides care for seniors who need uncomplicated diabetic management near where they live. Or, it could be for a large hospital in that requires the need for supplementary doctors, nurses, and health technicians, to cover vacation time or provide respite for teams in an on-going crisis like a pandemic.

Other features include:

- a booking and calendar system
- a messenger system to connect the business and applicant to protect personal information—messages cannot be deleted or edited by any party for security and safety purposes
- a video chat platform to allow face-to-face interviews if they are not in the same country, with a moderator for security and safety—recordings can only occur if every party involved agrees
- generic "profile pages", that allow both the client, and the business to share their photo and credentials and/or logo
- a payment system that covers the yearly fees for being a MedMart Member
    - professional applicants have different fees depending on their tier in health care, determined by their credentials

    - businesses have different fees depending on their size and location, which will be checked by a UX 4 U team designated for that
- a payment system for employers to pay employees if they do a working interview
- News section on latest medical advancements and scientific studies

Possible revenue streams for MedMart, besides its clientele, is the revenue from medical supply businesses' advertising their products and post-secondary educational institutions offering continuing education for healthcare professionals. They can buy space on MedMart's website for authenticated links to their websites depending on whether it meets ethical standards of practice for healthcare related conflicts-of-interest.

Future goals for MedMart by UX 4 U would be to provide this service world-wide so we can connect even more healthcare professionals with the communities who need them.

At UX 4 U, we believe that MedMart's potential features, revenue streams and future goals will make it a valuable asset to the healthcare industry.

Research Part (i)

Edin Husic

The research contains two peer-reviewed scholarly articles that explains techniques used in UX design to better capture the user's attention.

Set of Guidelines for Persuasive Interfaces: Organization and Validation of the Criteria

https://uxpajournal.org/set-of-guidelines-for-persuasive-interfaces-organization-and-validation-of-the-criteria/

This first article identifies key points for persuasive criteria along with a professional study to better highlight the importance of using persuasive techniques:

> "Thirty experts in human-computer interaction (HCI) were asked to use guidelines to identify and classify persuasive elements of 15 interfaces. The average percentage of correct identification was 78.8%, with Randolph's kappa coefficient = 0.61. These results confirm that the criteria for interactive persuasion, in their current form, can be considered as valid, reliable, and usable." (Némery, A. & Brangier, E. para. 2)

- This study identifies eight key persuasive criteria that are used to analyze interfaces
    - Credibility
        - Ensuring users view the site/design as trustworthy and reliable
    - Privacy

        - Protect user data
    - Personalization
        - Tailor data based on user preferences
    - Attractiveness
        - Use of aesthetics to capture user attention to elicit emotion and induce favorable action
    - Solicitation
        - Briefly attract and challenge the user to initiate a relationship
    - Priming
        - Using psychological methods to receive a desired decision
    - Commitment
        - Keeping the user engaged with our system. Involve them through a process
    - Ascendency
        - Provide incentives to get a user involved with the system

UX designers can use these set criteria to enhance persuasiveness of elements and to capture user attention. The next article will discuss user emotion and staying true to user experience.

Understanding UX Better: A New Technique to Go beyond Emotion Assessment

https://doi.org/10.3390/s21217183

This article describes some UX evaluation tips/techniques that can be used to determine the causes of negative user experience. The article explains a method called UX-Tips (User eXperience Technique for Interactive ProductS) that provides techniques to improve software's applications on desktop and mobile:

"UX-Tips is composed of 13 UX dimensions with 29 evaluative items. The dimensions are Aesthetics, Emotion, Engagement, Innovative, Social, Physical Characteristics, Utility, Control, Learning and Ease of Use, Efficiency, Feedback, Value-Added, and Satisfaction. In the following subsections, we present the definition of the dimensions that make up the UX-Tips technique and its evaluative items."

(Marques et al, Pg 6, para. 3).

- These techniques are as follows:
    - Aesthetics Dimension
        - Look at the screen layout, visual appearance, organization and clarity of the information in the application.
    - Emotion Dimension
        - Any positive or negative emotion that can be evoked by the application such as happy, sad, angry and other.
    - Engagement Dimension
        - Developing users' interest in the app so they come back for more, or recommend it to others or maintaining their curiosity in the app.
    - Innovative Dimension
        - The creative aspect of the application and whether its eye catching enough to grab users' attention. Includes something new and different that can arouse user's curiosity to explore the application.
    - Social Dimension
        - User interaction with other people within the application. For example, sharing experiences, being up to date on latest news, and other.
    - Physical Characteristics Dimension

        - Assesses the products weight, size and dimensions to determine if the product will please the user's needs. This characteristic is based on what type of product it is whether a mobile or desktop.
    - Utility Dimension
        - Evaluates whether the application is useful to users or consists of relevant functions. For example, good battery life, use of GPS or voice recognition function and other.
    - Control Dimension
        - Evaluates whether the user can freely interact with the application and isn't being controlled to follow specific instructions.
    - Learning and Ease of Use Dimension
        - Determines whether the application is obstacle free and is easy to use and learn in the first use. For example, tutorial/guide on how to use the application, use of images, text, icon and other.
    - Efficiency Dimension
        - Evaluates the performance of the applications and whether it processes information quickly and efficiently.
    - Feedback Dimension
        - Determines whether the application informs users of their actions and consequences. For example, informing user the time and percentage left to complete the task.
    - Value-Added Dimension
        - Evaluates what makes the application more valuable and important to user compared to other competitors in the market. For example, what benefits the app has and whether it satisfies their needs.
    - Satisfaction Dimension

- Evaluating whether the application meets user's expectations and delivers what was promised to the user.

This article's thirteen UX-Tips, and the first articles' eight guidelines can be used as a criterion to create an persuasive application that will be both user-friendly and engaging.

Research Part (ii)

Lev Kholodilov

As part of the research and development process, UX 4 U seeks input during our ideation and design phases from its current customer base through the use of emails and surveys. Here is a sample email with a link to potential Google Forms survey:

Subject: Health Professional Recruitment App Survey

Dear Iaso Memorial Hospital Management,

We are UX 4 U, LLC., a start-up company that consists of developers and designers who create applications for governments, businesses and non-profit organizations. We are based out of Waterloo, Ontario. Our applications ensure proper functionality, efficiency and user-friendly features. We believe in creating applications that cater to our clients and its consumers.

Our latest project was awarded a contract by the Government of Ontario, and we are now in the early stages of researching and developing a desktop website called MedMart. It will be dedicated in assisting the medical businesses of Ontario with the recruitment of certified health professionals.

As part of our development process, we obtain data from clientele using surveys. These surveys can cover topics like the platform's functions, functionality, and frequency of use.

We would appreciate if you could help us with our research by completing a short survey for MedMart. Your insight could significantly impact the outcome of the final platform. If you choose to participate, please follow this link for the survey:

https://forms.gle/XYVPdHSbxft3FrHN9

Please note that all information provided by survey participants is anonymous.
If you have any questions, please feel free to contact our survey department at 999-999-9999, extension 8. Thank you for your time and participation.

Best Regards,
The UX 4 U Team
2025 Coding Court
Waterloo, Ontario,

MedMart belongs to UX 4 U, LLC (A Division of Group 4)

Technical Issues

Lev Kholodilov

MedMart is being developed to hire highly qualified health professionals in Ontario and its surrounding areas. It will provide beneficial advantages by deploying hardware-oriented features to enhance user engagement as well as functionality.

Special Device Hardware Features:

1. Access to the Camera: Required for using online video interviews and identity verification processes, making registration and interview processes easier for candidates at home.
2. Geolocational Functionality: Useful for geo-oriented job positions as well as providing search functionality to make results more location-based and ether preferred work areas, with a unique point of aiming people to recruit in remote regions of Ontario.
3. Biometrical Security: Using facial recognition technology and fingerprint scanning to provide secure access to personal and professional information.

MedMart will require a variety of input controls and display features adopted for the usage of both professionals and employers.

Unique Control Inputs of Display Features:

1. Voice Recognition: To assist in navigation and data search, making the application more accessible to users on the go or during work shifts.
2. Adjustable Text Size and High-Contrast Mode: Ensures the app is accessible to people with varying visual capabilities, maintaining the accessibility standards.

3. Interactive Maps for Job Positions: Providing a visual and interactive way to find job positions around Ontario, especially highlighting needs in underserved areas.

The particular context of hiring medical employees in underserved and remote areas of Ontario through MedMart has unique advantages and disadvantages as follows in Table 1:

Table 1: Pros and Cons Related to Location

Advantage	Constraint
Targeting Recruitment Tools: The opportunity to focus on underserved regions using app functions like GPS and push notifications can make recruitment more efficient and effective.	**Internet Accessibility:** In rural areas, consistent and high-speed internet could be inaccessible, which could cause issues with the functionality of features like video interviews or real-time updates.
Data Collection and Analysis: Prioritizing applications' data to understand better how recruitment platforms work and their needs and successes, applying continuous hiring process improvement.	**Device Compatibility:** Ensuring the app works well on high and low-capability devices to reach a broader range of users.

Conclusion

Christine Bonneville

In conclusion, we feel that UX 4 U's MedMart, and its broad array of features for the recruitment of medical professionals by both civic and private businesses, will be a valued asset to the interconnected disciplines of healthcare, by creating more accessible health services to every type of community in Ontario, including the more remote locations. Our greatest hope is that MedMart will serve communities world-wide in near future.
